

The Forests Australia website provides up-to-date information on Australia's forests including forest-related publications and maps, and links to forest management organisations and institutions.

The website is hosted by [ABARES](#) in the Australian Government Department of Agriculture, Fisheries and Forestry. The website represents collaboration between many Australian forest-related organisations, including all Australian, state and territory governments.

Reports

The [state of Australia's forests](#) is reported across 44 indicators.

The following eight indicators are the latest to be updated. They were published in April 2026.

- 4.1a Area of forest land managed primarily for protective functions (previously updated October 2024)
- 6.1e Degree of recycling of forest products
- 6.2a Investment and expenditure in forest management
- 6.3a Area of forest available for public recreation/ tourism
- 6.3b Range and use of recreation/tourism activities available
- 6.4a Area of forest to which Indigenous people have use and rights that protect their special values and are recognised through formal and informal management regimes (previously updated October 2024)
- 6.4b Registered places of non-Indigenous cultural value in forests that are formally managed to protect those values
- 6.4c The extent to which Indigenous values are protected, maintained and enhanced through Indigenous participation in forest management

Previously updated indicators include:

Indicator 1.1a Area of forest by forest type and tenure published December 2023 in four parts -

- 1.1a.i Forest area by type
- 1.1a.ii Forest area by tenure
- 1.1a.iii Forest area in Regional Forest Agreement regions
- 1.1a.iv Forest area change over time

Eight indicators published July 2024 -

16 indicators published October 2024 -

- Indicator 1.2a Forest dwelling species for which ecological information is available
- Indicator 1.2b The status of forest dwelling species at risk of not maintaining viable breeding populations, as determined by legislation or scientific assessment
- Indicator 1.3a Forest associated species at risk from isolation and the loss of genetic variation, and conservation efforts for those species
- Indicator 1.3b Native forest and plantations of indigenous timber species which have genetic resource conservation mechanisms in place
- Indicator 2.1a Native forest available for wood production, area harvested, and growing stock of merchantable and non-merchantable tree species
- Indicator 2.1c Annual removal of wood products compared to the volume determined to be sustainable for native forests and future yields for plantations
- Indicator 2.1e The area of native forest harvested and the proportion of that effectively regenerated, and the area of plantation harvested and the proportion of that effectively re-established
- Indicator 3.1a Scale and impact of agents and processes affecting forest health and vitality
- Indicator 3.1b Area of forest burnt by planned and unplanned fire
- Indicator 4.1a Area of forest land managed primarily for protective functions
- Indicator 5.1a Contribution of forest ecosystems and forest industries to the global greenhouse gas balance
- Indicator 6.1a Value and volume of wood and wood products
- Indicator 6.1d Production and consumption and import/export of wood, wood products
- Indicator 6.2b Investment in research, development, extension and use of new and improved technologies
- Indicator 6.4a Area of forest to which Indigenous people have use and rights that protect their special values and are recognised through formal and informal management regimes
- Indicator 7.1e Capacity to conduct and apply research and development aimed at improving forest management and delivery of forest goods and services

Eight indicators published December 2025 -

Australian plantation log availability – the next 40 years is an ABARES Insights paper, which presents projections of plantation log availability over the next four decades. The projections provide insight into potential log production enabling growers, processors and policymakers plan investment, manage risk and support the sector's competitiveness and resilience.

[Australia's native forests and wood production](#) is an ABARES Insights paper describing Australia's native forests managed for wood production, the sustainable wood harvesting that is carried out within them, and other ecosystem services that they provide. Future opportunities and challenges regarding native forests managed for wood production are also discussed.

The [Australian wood volumes analysis](#) was announced as a 2022 election commitment during a period of uncertainty in the forest and wood products sector. The purpose of the wood volumes analysis is to give confidence that Australians have sufficient access to forest and wood products for the construction sector, from a range of sources.

[An analysis of plantation productivity](#) is a report that begins to describe productivity improvements within the Australian plantation estate over the past 15 to 20 years. Comparisons of current and historical Mean Annual Increment (MAI) estimates were chosen as a useful starting point for analysis. MAI is the average annual volume growth of a tree or stand of trees over its entire age, calculated as the volume of logs harvested, divided by the number of years since planting. In the context of an economic analysis MAI can be considered a partial measure of productivity. Insights from consultations with growers provide additional context on drivers of and barriers and risks to productivity increases for the sector.

Datasets

[National Plantation Inventory regions boundaries \(2016\) dataset Version 2](#) describes the boundaries of the 15 National Plantation Inventory (NPI) regions for Australia.

Regional Forest Agreements (RFAs) are long-term Commonwealth–state agreements for the conservation and sustainable management of specific regions of Australia's native and plantation forests. The [Regional Forest Agreements and Comprehensive Regional Assessment boundaries dataset](#) defines the areas that were supplied by states for the Regional Forest Agreements process and includes RFA regions in New South Wales, Tasmania, Victoria and Western Australia, and for Queensland a Comprehensive Regional Assessment region.

[Australia's Indigenous land and forest estate \(2024\)](#) is a continental spatial dataset that identifies and reports separately the individual attributes of Australia's Indigenous estate. It describes the extent of land and forest over which Indigenous peoples and communities have ownership, management or co-management, or other special rights, and was assembled for [Australia's State of the Forests Report](#).

[Fires in Australia's Forests 2016–21 \(2024\)](#) is a continental spatial dataset that identifies areas of forest burnt by planned and unplanned fires between July 2016 and July 2021, assembled for [Australia's State of the Forests Report](#).

[Forest-dwelling species and threatened forest ecological communities of Australia dataset \(2024\)](#) is a continental dataset of forest-dwelling species and forest ecological communities as at December 2021, assembled for [Australia's State of the Forests Report](#).
