

We inspect and test imported food under the [Imported Food Inspection Scheme \(IFIS\)](#). The type and rate of tests applied depend on whether the food is a [risk or surveillance food](#).

What we report

These reports list 'failing foods' under the [Imported Food Control Act 1992](#). They show food imports that have failed analytical testing, or for containing non permitted additives or ingredients. They also show food is not permitted because it may be a prohibited plant, or fungi.

These reports don't list food that has failed for having non-compliant labels. If a food fails a label inspection, the importer can fix the label, re-export the food or destroy it.

For an annual overview of inspection activity see our [Imported Food Inspection data reports](#).

What happens next

If the failing food is a surveillance food, we can apply a holding order. This will refer all future consignments of that food for inspection. A holding order remains in place until a history of compliance can be demonstrated, usually after five consecutive passes. See a list of published [holding orders](#).

If the failing food is a risk food we will refer 100% of future consignments until a compliance history is established.

Monthly reports

Subscribe for monthly reports

To stay updated on monthly failing food reports, subscribe to the Imported Food Inspection Scheme [imported food notices](#). This will ensure that you receive both:

- Imported Food Inspection Scheme (IFIS) imported food notices, and
- monthly failing food reports.
