

Adult description 8 of 15

Size: Females of *B. brachycelus* 25 to 35 mm, males 20 to 25 mm. Other species females up to 40 mm.

Adult Description: Colour in all species of *Bermius* is mainly green with light olive greens and yellow greens dominant on the body and legs while fawn brown along the entire top of body. All species characterised by a smooth, shiny almost 'porcelain' like texture. This is shared with several very closely related genera like *Bermiella*, *Bermoides* and *Oxya*, but very different to the rougher texture and patterns of most economic species. A light stripe on the side of the thorax to the rear legs. In profile the head, thorax and wings are level. Rear leg femur a lighter green than the body with a light brownish top and knee. The tibia sometimes bluish to pink tint. Hind wings clear. A downward pointing throat peg present.

Confusion with Australian plague locust: A similar size and shape only.

Confusion with *Aiolopus*: Similar elongate and often green body

Unique features: The shiny smooth texture and light green colours, with a throat peg, are unique to this group. No red shanks and 'X' mark on the thorax.
