

We have completed our review of import conditions for whole egg, egg yolk, egg white powder from approved countries.

Steps to complete this risk analysis

When we do a risk analysis, we:

- start the risk analysis by reviewing the science on pests and diseases of concern
- assess and analyse biosecurity risks
- develop proposed risk management measures
- consult the public on the draft report and then review comments
- publish a final report
- develop import conditions
- publish import conditions in our Biosecurity Import Conditions System (BICON)

[Register in BICON](#) to receive an alert when we publish the import conditions.

About the final report

The review found that the likelihood of viable virus being present in egg powders is lower than previously assessed, and that thermal treatment requirements for egg powders could be reduced while still providing sufficient biosecurity risk management to meet Australia's ALOP.

This review recommends the existing import conditions continue to be accepted and the following new heat treatment requirements be added as alternative options:

Whole egg and egg yolk powder conditions:

Require heat treatment of the product by pasteurisation of liquid whole egg and egg yolk for a minimum of 65°C for 6 minutes.

Egg white powder conditions:

Require heat treatment of the product after spray-drying by 'hot-boxing' for a minimum of 65°C for 5 days.
