

Quality transport infrastructure is essential for efficiently moving logs from plantations to mills for processing or ports for export.

The then Department of Agriculture and Water Resources engaged CSIRO in 2016 to expand its Transport Network Strategic Investment Tool (TraNSIT) to include networks across Australia for transporting production from plantation forests.

TraNSIT's most important value is in the opportunities it provides for optimising transport routes across supply chains and informing future investment in transport infrastructure.

TraNSIT was first developed to analyse transport and logistics options for the livestock sector in northern Australia. Under the Agricultural Competitiveness White Paper, it was expanded to include the movement of most bulk agriculture commodities nation-wide, see [TraNSIT](#).

CSIRO completed the project to add plantation forest transport networks to TraNSIT in 2017, and its report is available below.

Potential users can have modelling undertaken by CSIRO, see [Transport logistics-TraNSIT - CSIRO](#).
