

Australia is a party to international treaties that govern the trade of goods. As a member of the World Trade Organization (WTO), Australia is obliged to ensure that sanitary (relating to human and animal health) and phytosanitary (relating to plant health) measures are based on science and applied only to the extent necessary to protect human, animal or plant life or health.

Under the [WTO Agreement on the Application of Sanitary and Phytosanitary Measures \(SPS Agreement\)](#), the [International Plant Protection Convention \(IPPC\)](#) is recognised as the international organisation to set international standards for phytosanitary measures.

We work closely with state and territory governments and industry to implement international plant protection standards to protect Australia's plant resources from harmful pests, while ensuring that the measures are justified and are not used as unjustified barriers to international trade.

International Plant Protection Convention (IPPC)

Australia is a contracting party to the IPPC, which is a multilateral treaty for cooperation in plant health and protection under the auspices of the Food and Agriculture Organization of the United Nations (FAO).

The goal of the IPPC is to protect the world's cultivated and natural plant resources from the spread and introduction of plant pests while minimising interference with the international movement of goods and people.

The IPPC recognises a countries' right to use phytosanitary measures to regulate imports of plants, plant products and objects that may harbour plant pests. Parties to the IPPC are obliged to conform to principles of necessity, technical justification and transparency in their regulatory activities governing the importation of plant and plant products. In return, parties benefit from participating in discussions covering international trade agreements, standard setting, technical assistance and other means of information exchange. More than 180 countries are signatory to the IPPC.

Commission on Phytosanitary Measures

The IPPC is governed by the [Commission on Phytosanitary Measures \(CPM\)](#), which meets annually to promote cooperation to help implement the objectives of the IPPC. It has established the rules and procedures for the CPM and its subsidiary bodies, including the [IPPC Standards Committee](#). In particular, the CPM:

- reviews the state of plant protection around the world
- identifies action to control the spread of pests into new areas
- develops and adopts international standards
- establishes rules and procedures for resolving disputes

- establishes rules and procedures for the sharing of phytosanitary information
- cooperates with international organisations on matters covered by the Convention.

International Standards for Phytosanitary Measures

International Standards for Phytosanitary Measures (ISPMs) are developed through an agreed and defined process of draft development and member consultation, and in accordance with the legal framework established by the IPPC and the SPS Agreement.

Although the IPPC is a legally binding international agreement, the standards developed and adopted by the Convention are not. However, WTO members are required to base their phytosanitary measures on international standards developed within the framework of the IPPC.

Phytosanitary measures that conform to the ISPMs are presumed to be consistent with the relevant provisions of the SPS Agreement. Measures that are not based on international standards, or measures that exist in the absence of international standards, must be developed through the assessment of the risk to plant life or health, and must be based on scientific principles and evidence.

Emergency (or provisional) measures may be taken without such analyses. However, they must be reviewed for their scientific justification and modified accordingly to be legitimately maintained.

Australia's Fruit Fly pest free areas

Australia's vast continent, regional environmental conditions and significant commitment and investment to manage Mediterranean fruit fly and Queensland Fruit Fly, provides internationally-recognised fruit fly pest-free areas. This helps facilitate trade of horticultural commodities susceptible to these pests.

Australia has implemented biosecurity systems and adopted a nationally coordinated approach to manage and control the threat posed by fruit flies. This includes protecting:

- central and eastern Australia from the Mediterranean fruit fly
- established fruit fly free areas of Tasmania and the Riverland in South Australia.

Measures include domestic controls and a national surveillance trapping network which are maintained in accordance with the relevant ISPMs.

Australian participation in international standards setting

Australia actively participates in international standards setting for plant health (phytosanitary) measures by contributing through international and regional organisations, such as:

- **International Plant Protection Convention (IPPC)**
- **Pacific Plant Protection Organisation (PPPO)**
- **Asia and Pacific Plant Protection Commission (APPPC).**

Public consultation

Members of the public, particularly those with an interest in technical matters concerning plant health are invited by the Australian IPPC Secretariat to comment on draft ISPMs.

All Australian comments on draft ISPMs must be submitted through the Australian IPPC Secretariat—see [member consultation on draft ISPMs](#) for information about the consultation process.

To get involved in international standard setting, contact the Australian Chief Plant Protection Office on 1800 900 090, by [email](#) or by mail:
