1 Summary

The Australian Government Department of Agriculture, Fisheries and Forestry (the department) has prepared this report after undertaking a review of the biosecurity risks associated with the importation of live psittacine birds into Australia.

Australia has previously permitted the importation of live psittacine birds. However, the import policy was suspended in 1995 due to incomplete knowledge of certain diseases of psittacine birds and a lack of suitable methods for testing imported birds for the presence of these diseases.

2 Introduction

2.1 Australia's biosecurity policy framework

Australia's biosecurity policies aim to protect Australia against risks that may arise from exotic pests and diseases entering, establishing and spreading in Australia, thereby threatening Australia's unique flora and fauna, agricultural industries that are relatively free from serious pests and diseases, and human health.

Risk analysis is an important part of Australia's biosecurity policies. It enables the Australian Government to formally consider the level of biosecurity risk that may be associated with proposals to import goods into Australia. If the biosecurity risks do not achieve Australia's ALOP, risk management measures are proposed to reduce the risks to an acceptable level. If the risks cannot be reduced to an acceptable level, the goods will not be imported into Australia until suitable measures are identified.

Successive Australian governments have maintained a conservative, but not a zero risk, approach to managing biosecurity risks. This approach is reflected in Australia's ALOP, which reflects community expectations through government policy and is currently described as providing a high level of protection aimed at reducing risk to a very low level, but not to zero.

Australia's risk analyses are undertaken by the Department of Agriculture, Fisheries and Forestry using technical and scientific experts from relevant fields and involve consultation with stakeholders at various stages during the process.

Risk analyses conducted by the department are consistent with Australia's international obligations including those under the World Trade Organization (WTO) Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) and the World Organisation for Animal Health (WOAH). Risk analyses go towards meeting our international obligations whilst addressing the various risks that goods may pose.

Risk analyses may take the form of a regulated biosecurity import risk analysis (BIRA) or a non-regulated risk analysis (such as scientific review of existing policy and import conditions, or scientific advice).

More information about Australia's biosecurity framework is provided in the [Biosecurity import risk analysis guidelines 2016](#).

The department recognises that new scientific information and technologies, or other combinations of measures, may provide an equivalent level of biosecurity protection for the disease agents identified in this report as requiring risk management. The department will consider technical submissions that objectively demonstrate alternative biosecurity measures.

2.2 This risk review

2.2.1 Background

Conditions for the importation of psittacine birds from approved countries were developed and finalised in 1989. Imports commenced in 1990 and between 1990 and 1995 approximately 4,800

birds were imported. A review of the importation program commenced in 1992 and, in 1995, the conditions were suspended due to concerns over the unacceptable risk of introduction of certain exotic diseases of psittacine birds. Presently, the only psittacine birds that can be imported into Australia are pet birds from New Zealand whose owners are moving to Australia to reside permanently.

The department initiated this review in response to numerous requests from pet psittacine bird owners, hobbyists and zoos to develop a safe importation pathway. Stakeholders were notified of the formal commencement of this review via [Biosecurity Advice 2016-14](#) on 2 May 2016.

2.2.2 Scope

S. 47E(d).

S. 47E(d).

2.2.3 Existing policy

The *Biosecurity Act 2015* and its subordinate legislation provide the legal basis under which biosecurity requirements for the importation into Australia of live animals and products derived from animals are regulated. The department implements and administers these requirements.

Import policy exists for household pet birds from New Zealand. Pet birds must have been in the ownership and possession of the owner for a minimum period of one year immediately preceding pre-export quarantine to be eligible for export to Australia and must be accompanied by an import permit and a New Zealand Government veterinary certificate confirming that the animal has undergone pre-export inspection and quarantine in accordance with Australian requirements. The birds must also undergo post-entry inspection and quarantine in Australia. The [import conditions](#) for live psittacine birds from New Zealand can be found on the department's website.

In addition to biosecurity import requirements for live psittacine birds the importation of live animals is regulated under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act),

which is administered by DCCEEW. Under the EPBC Act, live psittacine birds may only be imported if they appear on the [List of Specimens taken to be Suitable for Live Import](#) (Live Import List).

If a specimen is not on the Live Import List, then the specimen cannot be imported. Anyone, whether a member of the public, a public or private institution, or a commercial enterprise, can apply to the Minister for the Environment to amend the Live Import List to include a new specimen. More information can be found on the [Live Import List](#) webpage. Changes to the Live Import List were not within the scope of this review.

Australia is also a Party to the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). CITES is an international agreement between governments that aims to ensure that the international trade in wildlife does not threaten wild populations of animals. Australia registers a [List of CITES Species](#) under the EPBC Act. Both commercial and non-commercial trade in CITES listed animals is regulated. This includes the transfer of live animals between zoos. Animals are listed under CITES in one of the 3 appendices, depending on the threat of international trade to the survival of the species. Under the EPBC Act, Australia has adopted a range of domestic measures that impose additional requirements and, in some cases, further restrict trade in CITES listed species. CITES and the EPBC Act requirements were not within the scope of this review.

Domestic arrangements

Although the Australian Government is responsible for regulating the movement of animals and animal products into and out of Australia, Australian state and territory governments are responsible for animal health and environmental controls within their jurisdictions. Legislation relating to resource management or animal health may be used by state and territory government agencies to control interstate movement of animals and their products. Once animals and animal products have been cleared by Australian Government biosecurity officers, they may be subject to interstate movement conditions. Some jurisdictions require importers to apply for entry in writing, and some species are not permitted entry to some jurisdictions (despite inclusion on the Live Import List). It is the importer's responsibility to identify and ensure compliance with all requirements. More information can be found on Australian state and territory government websites.

2.2.4 Consultation

On 2 May 2016, [Biosecurity Advice 2016-14](#) was released announcing the commencement of this review. Following the release of a draft risk review report on 21 July 2020, Animal [Biosecurity Advice 2020-A04](#), stakeholders were invited to comment and draw attention to any scientific, technical, or other gaps in the data, misinterpretations or errors, within a 60-day consultation period. During the consultation period stakeholders were invited to attend a webinar to discuss the draft report. A transcript and answers to the questions posed are on the department's website. All stakeholder feedback was taken into consideration in this final report.

In order to support a robust evidence base, the department also sought expert opinion from the scientific community on issues relevant to this risk review.

After receiving stakeholder feedback on the draft report, the department delayed publishing the final review report in order to seek and consider further input about the potential biosecurity risks relating to the environment both directly (including the life and health of wildlife) and indirectly

(including biodiversity, endangered species and ecosystems). To accomplish this, the department engaged an independent expert panel - in a similar method employed when conducting a regulated Biosecurity Import Risk Analysis (BIRA) in the Biosecurity Act 2015 - to provide external scientific and technical advice on risk analysis and biosecurity matters. The panel members provided their report to the department in September 2023, finding that the department had appropriately considered stakeholder submissions and available scientific evidence relevant to environmental biosecurity concerns.

8 Appendix B: Live Import List and CITES

The import of live animals into Australia is also regulated by the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act), as administered by the Department of Climate Change, Energy, the Environment and Water (DCCEEW).

Animal specimens considered suitable for live import into Australia are listed on the Live Import List. The list is divided into 2 parts:

- Part 1 is a list of live specimens that do not require an import permit under the EPBC Act.
- Part 2 is a list of live specimens that require an import permit under the EPBC Act. Conditions and restrictions may be imposed on any imports of these specimens.

If a live specimen is not included on the Live Import List, then the specimen cannot be imported.

In addition, Australia implements the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) through the EPBC Act. CITES is an international agreement between governments that aims to ensure that the international trade in wildlife does not threaten wild populations of plants and animals.

Australia registers a List of CITES Species under the EPBC Act (List of CITES Species for the Purposes of the Act). This list includes:

- details of the CITES Appendix in which a species is listed
- the date on which the CITES provisions first applied to the species
- any conditions or restrictions that may apply to the specimen.

Both commercial and non-commercial trade of CITES listed animals is regulated. This includes the transfer of live animals between zoos.

Animals are listed under CITES in 1 of the 3 Appendices, depending on the threat of international trade to the survival of the species:

- Appendix I: lists species currently threatened with extinction from international trade
- Appendix II: lists species not currently threatened with extinction but could become so if trade is not regulated
- Appendix III: lists specific populations of species or species threatened only in a specific country.

Further information can be found on the following websites, or by contacting DCCEEW:

DRAFT

10 Glossary

Term or abbreviation	Definition
AA	Approved arrangement. An arrangement for which an approval is in force under paragraph 406(1)a of the Biosecurity Act 2015.
ACT	Australian Capital Territory
ALOP	Appropriate level of protection
AUSVETPLAN	Australian Veterinary Emergency Plan
Australian territory	Australian territory as referenced in the <i>Biosecurity Act 2015</i> refers to Australia, Christmas Island and Cocos (Keeling) Islands.
BA	Biosecurity advice
BICON	Australia's Biosecurity Import Condition System
biosecurity	The prevention of the entry, establishment or spread of unwanted pests and infectious disease agents to protect human, animal or plant health or life, and the environment.
biosecurity import risk analysis (BIRA)	The <i>Biosecurity Act 2015</i> defines a BIRA as an evaluation of the level of biosecurity risk associated with particular goods, or a particular class of goods, that may be imported, or proposed to be imported, into Australian territory, including, if necessary, the identification of conditions that must be met to manage the level of biosecurity risk associated with the goods, or the class of goods, to a level that achieves the ALOP for Australia. The risk analysis process is regulated under legislation.
biosecurity measures	The <i>Biosecurity Act 2015</i> defines biosecurity measures as measures to manage any of the following: biosecurity risk, the risk of contagion of a listed human disease, the risk of listed human diseases entering, emerging, establishing themselves or spreading in Australian territory, and biosecurity emergencies and human biosecurity emergencies.
biosecurity risk	The <i>Biosecurity Act 2015</i> refers to biosecurity risk as the likelihood of a disease or pest entering, establishing or spreading in Australian territory, and the potential for the disease or pest causing harm to human, animal or plant health, the environment, economic or community activities.
EADRA	Emergency animal disease response agreement
ELISA	enzyme-linked immunosorbent assay
endemic	Belonging to, native to, or prevalent in a particular geography, area or environment.
FAO	Food and Agriculture Organization of the United Nations
GAV	Government Approved Veterinarian
goods	The <i>Biosecurity Act 2015</i> defines goods as an animal, a plant (whether moveable or not), a sample or specimen of a disease agent, a pest, mail or any other article, substance or thing (including, but not limited to, any kind of moveable property).
host	An organism that harbours a parasite, mutual partner, or commensal partner, typically providing nourishment and shelter.
import permit	Official document authorising a person to bring or import particular goods into Australian territory in accordance with specified import requirements.
IRA	Import risk analysis
non-regulated risk analysis	Refers to the process for conducting a risk analysis that is not regulated under legislation (<i>Biosecurity import risk analysis guidelines 2016</i>).
NSW	New South Wales

NT	Northern Territory
WOAH	World Organisation for Animal Health
WOAH Code	WOAH Terrestrial Animal Health Code
WOAH Manual	OIE Manual of Diagnostic Tests and Vaccines for Terrestrial Animals
OV	Official Veterinarian
pathogen	A biological agent that can cause disease to its host.
PCR	Polymerase chain reaction. For simplicity, in this report PCR is used to refer to both polymerase chain reaction and reverse transcriptase polymerase chain reaction, recognising that the former aims to detect DNA and the latter RNA.
Psittacine	Psittacine birds include all bird species within the order Psittaciformes. Examples include lorries, cockatoos, cockatiels, rosellas, lovebirds and parrots.
Qld	Queensland
qPCR	Real-time PCR. As with PCR, in this report qPCR is used to refer to both real-time polymerase chain reaction and real-time reverse transcriptase polymerase chain reaction, recognising that the former aims to detect DNA and the latter RNA.
quarantine	Official confinement of regulated articles for observation and research or for further inspection, testing or treatment.
restricted risk	Risk estimate with phytosanitary measure(s) applied.
risk analysis	Refers to the technical or scientific process for assessing the level of biosecurity risk associated with the goods, or the class of goods, and if necessary, the identification of conditions that must be met to manage the level of biosecurity risk associated with the goods, or class of goods to a level that achieves the ALOP for Australia.
SA	South Australia
SPS Agreement	WTO Agreement on the Application of Sanitary and Phytosanitary Measures.
stakeholders	Government agencies, individuals, community or industry groups or organisations, in Australia or overseas, including the proponent/applicant for a specific proposal, that have an interest in the policy issues.
surveillance	An official process that collects and analyses information related to animal health.
unrestricted risk	The risk estimate in the absence of risk mitigation measures.
vector	An organism that does not cause disease itself, but which causes infection by conveying pathogens from one host to another.
VIC	Victoria
WA	Western Australia
WTO	World Trade Organization
